

# Legend of AI and Cloud Security

# Troy Leach

Chief Strategy Officer  
Cloud Security Alliance

# Son Ho

President -CSA Vietnam Chapter  
Co-founder & VP – Robusta Technology

# About CSA and Vietnamese Chapter

**CSA Vietnam Chapter** founded in 2015, with 3 co-founders and 15 starting members.

The chapter has organized many Vietnam Summits, webinars, local meetings as well as participating in local IT industry's events.

Our objectives and missions include the following:

- Promote secure cloud adoption in Vietnam and recruit members (volunteers) for the CSA Vietnam Chapter.
- Enhance cloud and cybersecurity knowledge within the community.
- Network with local and global peers facing similar cloud security challenges.
- Advocate best practices for cloud security, providing education and consulting on CSA's international standards and frameworks.

# What We Hope You Take Away

- Impactful Differences of GenAI and Cloud
- Identify what we can leverage from our established best practices and experiences
- Identify where we must be pioneers in security and auditing

# What is AI Good At?

## AI Strengths:

- ✓ Reasoning and logic
- ✓ Communication skills
- ✓ Synthesizing information
- ✓ Pattern identification
- ✓ Creative problem-solving
- ✓ Translation
- ✓ Unstructured Data

## AI Limitations:

- ✗ Non-deterministic behavior
- ✗ Accuracy
- ✗ Repeatability challenges
- ✗ Limited memory retention
- ✗ Speed & cost efficiency

“

Genius 13-year-old. Overconfident with short attention span and no street smarts”

# AI and Cloud Adoption in Payments

Substantial changes that have occurred in recent years months

## Payment Data in Cloud

- Large volume of payment processing
- Immediate accessibility to global resources
- Continuous Assurance
- Critical Back Up Assurance
- Scalability to modify immediately

## Payment Data in AI

- Personalization of Services
- Identify Payment Patterns
- Automation of policy and procedures
- Use of Synthetic Data

# New Opportunities with GenAI + Cloud

"Just Walk Out" technology, which uses AI and cloud computing to enable checkout-free shopping experiences, processes millions of transactions annually

65% of large retailers have implemented some form of AI

Cloud adoption in the retail payments industry has reached higher than 80%,

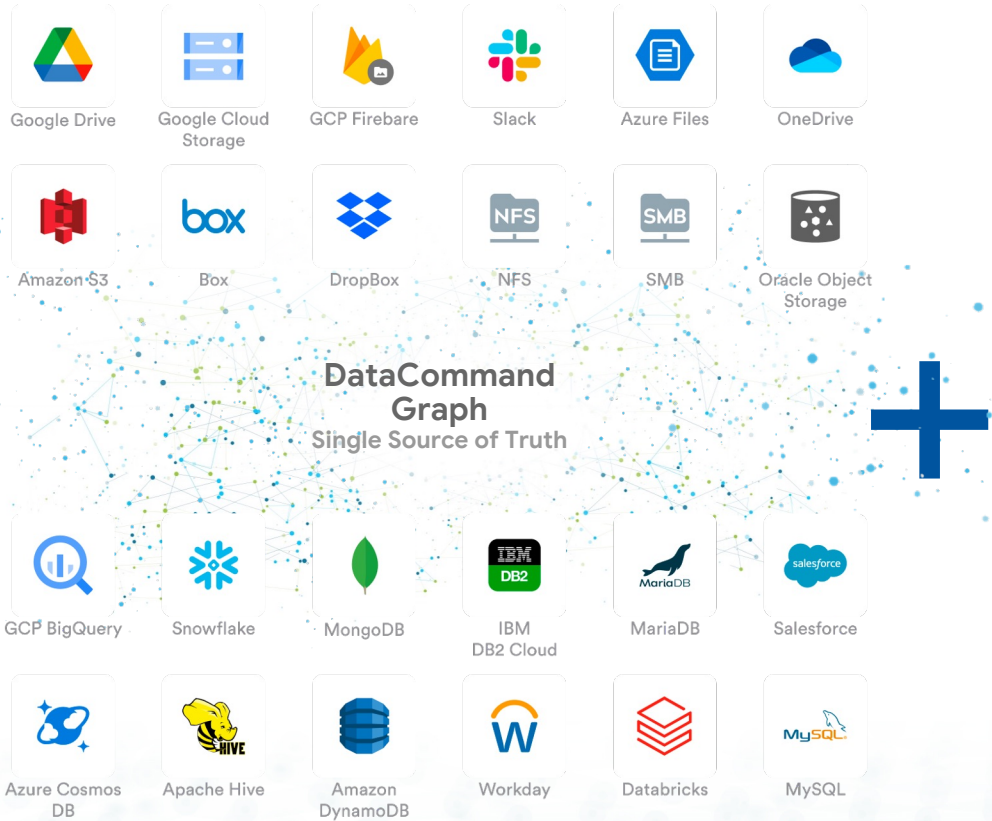

40% of retailers experimenting with GenAI for payments

McKinsey: GenAI could add equivalent of \$2.6T – 4.4T of value annually

# Data + GenAI Will Drive Major Transformations in Payments

## Where Payment Data May Exist

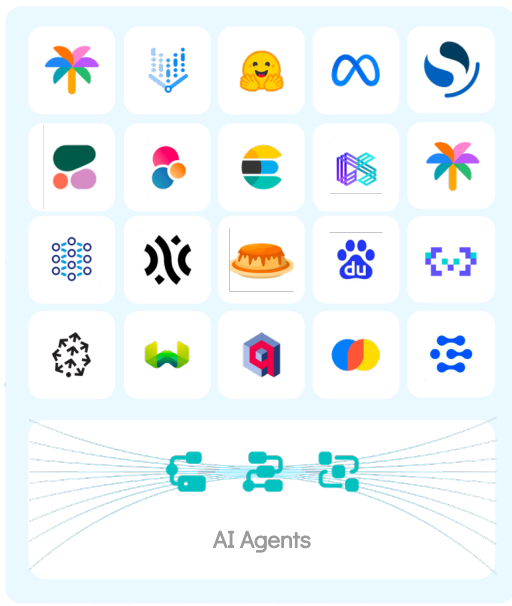

### Unstructured Data

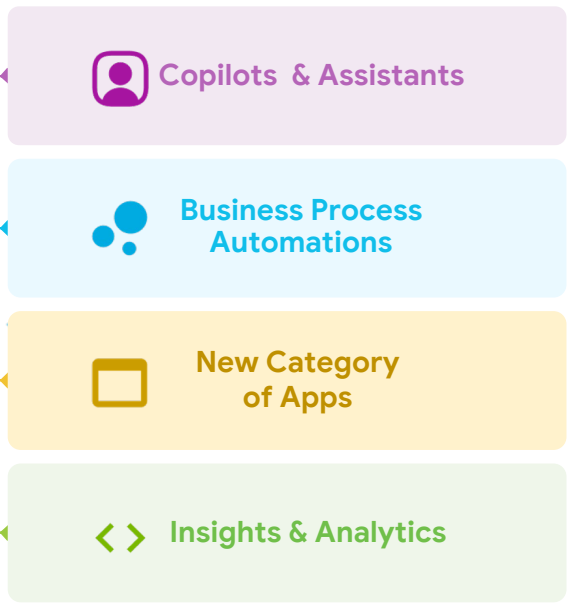

### Structured Data

## GenAI Models

### Multicloud AI Models + Agents

## GenAI Apps & Innovation

## GenAI Apps & Assistants

# Example of AI Agent in Payments

- Increase in use for chatbots and other consumer interfaces
  - What happens when AI creates its own company policy?
- Overprivilege of access to AI Assistants
  - What happens when users AI assistants have access to everything?
  - MS report stating more than 50% of accounts have super privilege to access sensitive information

# Top Security Uses for AI

Reasoning and Logic enables better **Rule Creation**

Creative Problem Solving Empowers **Attack Simulation**

Pattern Identification Increases **Regulatory Adherence**

Synthesizing large data sets Improves **Detection**

<b>21%</b>	Rule creation	<b>13%</b>	Natural language to search
<b>19%</b>	Attack simulation	<b>13%</b>	Threat summarization
<b>19%</b>	Compliance violation monitoring	<b>13%</b>	Data loss prevention, IP protection
<b>16%</b>	Network detection	<b>11%</b>	User Behavior analysis
<b>16%</b>	Reduce false positives	<b>10%</b>	Automated report generation
<b>15%</b>	Training development and support	<b>10%</b>	Endpoint detection
<b>14%</b>	Anomaly classification	<b>9%</b>	Event log summarization

# AI Proactive Security In Payments

Emerging techniques that are here today and will help you tomorrow

## Incident Investigation

Can conduct Root Cause Analysis by combing through massive amounts of data quickly to identify anomalies in network traffic and system logs to pinpoint origin of attack

AI tools can reconstruct the sequence of events leading up to an incident

## Intelligence Analysis

Aggregate and analyze threat intelligence from multiple sources, continuously to report on emerging attack vectors

Can be trained to initiate predefined responses such as isolating affected systems

## Training and Onboarding

AI can analyze data from different department and roles to understand unique challenges and generate training material relevant to the employee

When staff make an inquire for elevated access which is not permitted, AI can Slack the individual to coach them on why access was denied

## Documentation and Reporting

Can monitor all changes to the environment and create continuous assurance that the all documentation is current

Can generate multi-queries to analyze various regulations and use cases for data and assign controls to relevant framework

# AI Agent Example for New Payment Transaction

Identifying legitimacy of new payment transaction in network

- Example of how AI would evaluate risk from intel gathered from Jira, Slack, meeting minutes
- New payment transaction identified.

Payment processor is a trusted provider & only outbound calls are allowed

Engineering documentation and discussions have identified this new payment provider being implemented

Payment processor libraries were introduced to code repo “payment-lib” on 3.3.2024

A discussion with **Anna who is the active contributor** to “payment-lib” occurred at 1:22pm PT 3.3.2024 via Slack to confirm the domain stripe.com is allowed outbound

# Company Policy for LLM or Cloud Services

Basics to be mindful when staff engage with public models and infrastructure

- Identify AI and Cloud security professional(s) responsible for PCI responsibilities
- Catalog all approved LLM and cloud activities and scan for shadow access
- Create an official corporate AI Policy
- Communicate and Train on AI Policy
- Monitor activity and perform pentesting
- Stay informed on latest changes in LLM security

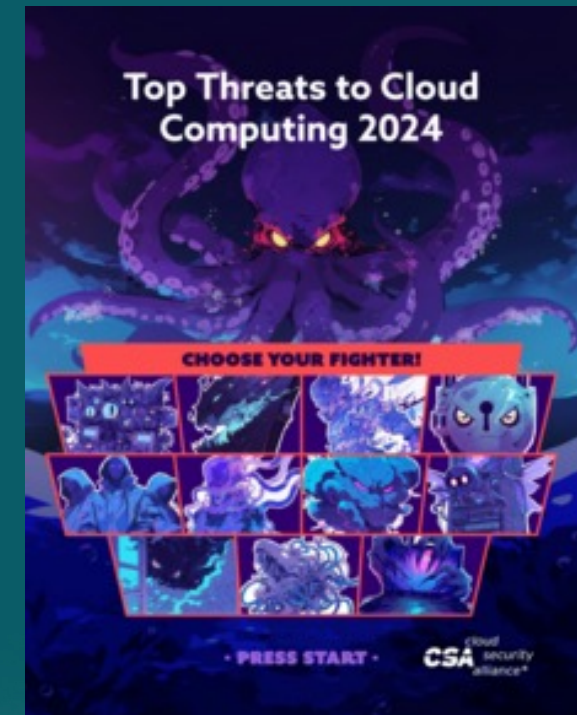

# Cloud Security Risk in Payments

## Top Threats to Cloud Computing

1. Misconfiguration & Inadequate Change Control
2. Identity & Access Mgmt (IAM)
3. Insecure Interfaces and APIs
4. Inadequate Selection/ Implementation of Cloud Security Strategy
5. Insecure Third-Party Resources

2024		2022	
	Misconfiguration & Inadequate Change Control	<b>1</b>	Identity & Access Mgmt (IAM) 
	Identity Access & Mgmt (IAM)	<b>2</b>	Insecure Interfaces and APIs 
	Insecure Interfaces and APIs	<b>3</b>	Misconfiguration & Inadequate Change Control 
	Inadequate Selection/ Implementation of Cloud Security Strategy	<b>4</b>	Inadequate Selection/ Implementation of Cloud Security Strategy 
	Insecure Third-Party Resources	<b>5</b>	Insecure Software Development 
	Insecure Software Development	<b>6</b>	Insecure Third-Party Resources 
	Accidental Cloud Disclosure	<b>7</b>	System Vulnerabilities 
	System Vulnerabilities	<b>8</b>	Accidental Cloud Disclosure 
	Limited Cloud Visibility/ Observability	<b>9</b>	Misconfiguration & Exploitation of Serverless & Container Workloads* 
	Unauthenticated Resource Sharing	<b>10</b>	Advanced Persistent Threats 
	Advanced Persistent Threats	<b>11</b>	Cloud Storage Data Exfiltration* 

\*Security issues not in the top 11 for 2024

# Cloud Security Opportunities in Payments

## Industry Research

- Cloud Security Guidance

- Zero Trust Methodology
- CI/CD
- Security Monitoring and Ops
- Resiliency
- Cloud Telemetry & Security Analytics

## Protecting Payment Data

- Confidential Computing
- Fully Homomorphic Encryption (FHE)
- Cloud Enclaves
- Data Lakes
- Network Security Zones
- Cloud HSM

# Shared Security Responsibility Model

A common interpretation of cloud service responsibility

Customers often have security responsibility “in” cloud services

CSPs often have security responsibility “of” cloud services

# Shared Security Responsibility Model

## Key is transparency

From Appendix A1: "...which PCI DSS requirements are the responsibility of the customer to meet, which are the responsibility of the TPSP, and which requirements are shared between both customer and the TPSP."

## Understanding role to manage TPSPs

Must monitor TPSP compliance, perform relevant due diligence, appropriate agreements, but PCI DSS Requirement 12.8 does not specify your TPSPs must be PCI DSS compliant for its customers to meet the requirement.

# How SSRM Within Cloud Controls Matrix Works

CSA's Shared Responsibility Model works in with same principles of PCI Council's: *PCI DSS Cloud Computing Guidelines*

As well as PCI SSC's *Information Supplement: Third-Party Security Assurance*

SSRM is embedded as part of the Cloud Controls Matrix

The screenshot displays the Cloud Controls Matrix (CCM) interface. At the top left is the CCM logo with the text "Cloud Controls Matrix". On the right side, there is a vertical "Copy" button. The main content is a table with the following columns: Question ID, Question, CSP CAIQ Answer, SSRM Control Ownership, CSP Implementation Description (Optional/Recommended), and CSC Responsibilities (Optional/Recommended). A dropdown menu is open over the "SSRM Control Ownership" column for the row with Question ID AAA-06.2. The dropdown options are: CSP-owned (highlighted in blue), CSC-owned, 3rd-party outsourced, Shared CSP and CSC, and Shared CSP and 3rd-party. The "CSP CAIQ Answer" column for the same row has a dropdown menu with options: Yes, No, and NA.

Question ID	Question	CSP CAIQ Answer	SSRM Control Ownership	CSP Implementation Description (Optional/Recommended)	CSC Responsibilities (Optional/Recommended)
AAA-06.1	Is a risk-based corrective action plan to remediate audit findings established, documented, approved, communicated, applied, evaluated, and maintained?				
AAA-06.2	Is the remediation status of audit findings reviewed and reported to relevant stakeholders?	Yes	CSP-owned		
AIS-01.1	Are application security policies and procedures established, documented, approved, communicated, applied, evaluated, and maintained to guide appropriate planning, delivery, and support of the organization's application security capabilities?	No	CSC-owned		
AIS-01.2	Are application security policies and procedures reviewed and updated at least annually?	NA	3rd-party outsourced		
AIS-02.1	Are baseline requirements to secure different applications established, documented, and maintained?		Shared CSP and CSC		
AIS-03.1	Are technical and operational metrics defined and implemented according to business objectives, security requirements, and compliance obligations?		Shared CSP and 3rd-party		
AIS-04.1	Is an SDLC process defined and implemented for application design, development, deployment, and operation per organizationally designed security requirements?				
AIS-05.1	Does the testing strategy outline criteria to accept new information systems, upgrades, and new versions while ensuring application security compliance?				

# Mapping of PCI DSS v4.0 to CCM v4

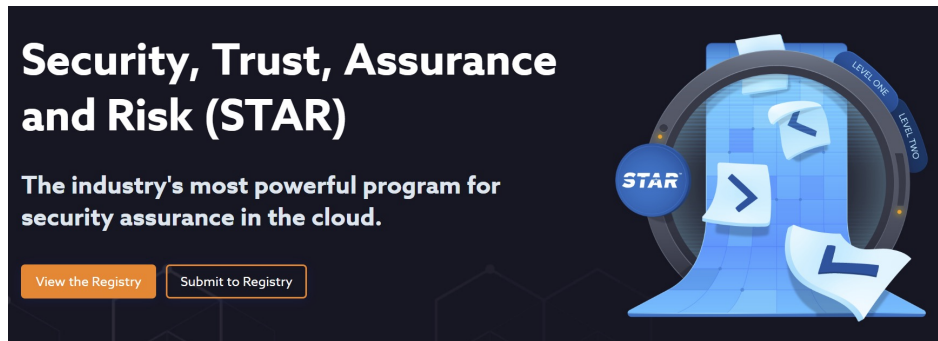

A method to identify shared responsibilities from the CSP perspective

- Analyze self-assessment or independent assessments for ISO 27001, SOC2 that have evidence for security practices of TPSPs
- Could be used as one source
  - 77% No or Partial Gap
  - 23% Full Gap due to different focus

CCM CLOUD CONTROLS MATRIX v4.0.12				PCI DSS v3.2.1		PCI DSS v4.0	
Control Domain	Control Title	Control ID	Control Specification	Gap Level	Addendum	Control Mapping	Gap Level
Application & Interface Security	Application Security Metrics	AIS-03	Define and implement technical and operational metrics in alignment with business objectives, security requirements, and compliance obligations.	Full Gap	The full V4 control specification is missing from PCI DSS v3.2.1 and has to be used to close the gap.	No Mapping	Full Gap
			Define and implement a SDLC process for application design, development, deployment, and operation in accordance with security requirements defined by the organization.	N/A			N/A
Application & Interface Security	Secure Application Design and Development	AIS-04		No Gap		6.2.1 6.2.3 6.5.2	No Gap
Application & Interface Security	Automated Application Security Testing	AIS-05	Implement a testing strategy, including criteria for acceptance of new information systems, upgrades and new versions, which provides application security assurance and maintains compliance while enabling organizational speed of delivery goals. Automate when applicable and possible.	No Gap	N/A	6.2.4 6.4.1 6.4.2 6.5.1	Partial Gap
Application & Interface Security	Automated Secure Application Deployment	AIS-06	Establish and implement strategies and capabilities for secure, standardized, and compliant application deployment. Automate where possible.	No Gap	N/A	6.5.1	Partial Gap

# Cloud Service Provider Reports Available in STAR

- STAR Registry is a free database for both cloud customers and cloud providers to share the results of their self-assessment or third-party assessments.
